TITLE: Polymerization of acrolein and its derivatives. I. Low-temperature polymerization of acrolein and  $\alpha$ -methyl acrolein

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 4, 1962, 528-532

TEXT: Acrolein (1) and  $\alpha$ -methyl acrolein (2) were polymerized in the presence of gaseous  $BF_3$  between 0 and  $-80^{\circ}C$  in block and in solution (solvent:  $CH_2Cl_2$ ). The experiments were made in sealed ampoules, partly with exclusion of  $O_2$  and  $H_2O$ , partly in the presence of very small amounts of  $H_2O$ . Results: Polymers obtained in block polymerization with 10-15% conversion are completely soluble in organic solvents. With a higher degree of conversion, the reaction product becomes insoluble in organic solvents but soluble in sulfuric acid. The reaction with 15-20% conversion without  $H_2O$  takes 15-30 hr at  $-20^{\circ}C$ , with  $H_2O$ , 3-8 hr.

Card 1/3

## Polymerization of acrolein and its ...

S/190/62/004/004/008/019  
B119/B138

The molecular weight of the polymer produced in the presence of  $\text{H}_2\text{O}$  is lower than in the one produced without water. Maximum conversion was attained at  $-20$  to  $-40^\circ\text{C}$  with 1.5 mole%  $\text{BF}_3$  (with 1) and 2.5 - 3 mole% (with 2). The block polymers give no aldehyde reaction, they are cyclized:

## Polymerization of acrolein in solution

gives a soluble product with a melting point of 150-170°C and 0.06 - 0.07 in benzene at -60°C and 30% conversion, but an insoluble and nonmelting product at -20°C and 30% conversion. The polymer obtained from dilute solutions is not cyclized. At -20°C the rate of polymerization decreases in the order acrolein -  $\alpha$ -methyl acrolein -  $\alpha$ -ethyl acrolein. There are 4 figures and 1 table.

TITLE: Synthesis and polymerization (copolymerization) of fluoron-  
substituted styrenes. I. Copolymerization of fluoron-  
substituted styrenes with vinyl monomers

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 6, 1962, 885 -

TEXT: This paper describes the authors' experiments in the production and characterization of the copolymers of  $\alpha$ ,  $\beta$ ,  $\beta'$ -trifluoro styrene with 2,5-dimethyl styrene and methyl methacrylate;  $\alpha$ -,  $m$ - and  $p$ -methyl- $\alpha$ ,  $\beta$ ,  $\beta'$ -trifluoro styrene with styrene,  $\alpha$ ,  $\beta$ -difluoro- $\beta'$ -chloro styrene with styrene, and 2,5-difluoro styrene. The emulsion used for copolymerization consisted of 80 - 85 % water, 2.5 emulsifier (sodium stearate or oleate), and 0.5 % persulfate initiator. The monomer mixture, which was added dropwise after heating to 80 - 90°C, contained azoisobutyric acid dinitrile (0.5 %) as initiator. Eleven copolymers of the above monomers were obtained. Their compositions and properties are given in Table 2. The heat

TITLE: The synthesis of lead organic metacrylates

PERIODICAL: Zhurnal obshchey khimii, v.32, no.9, 1962, 3057-3059

TEXT: The reactions of  $(C_6H_5)_3PbOH$  and  $(C_6H_5)_2PbO$  with isobutyric and metacrylic acids were studied in detail. The interaction of equimolar amount of  $(C_6H_5)_3PbOH$  and freshly distilled isobutyric acid in an alcoholic solution yielded triphenyllead monoisobutyrate (colorless crystals, m.p. 188-190°). The interaction of 0.026 g-moles of  $(C_6H_5)_2PbO$  and 0.054 g-moles freshly distilled isobutyric acid in an aqueous or alcoholic solution at 80-90°C yielded diphenyllead diisobutyrate (colorless crystals, m.p. 201-203°C). The main product of the interaction between one mole of  $(C_6H_5)_3PbOH$  and one to five moles of metacrylic acid in an aqueous medium at 60°C was triphenyllead monometacrylate (colorless crystals, m.p. 126-128°C); a smaller amount of diphenyllead dimetacrylate was also formed. Diphenyllead dimetacrylate crystallizes as a colorless solid which

TITLE: Emulsion polymerization of  $\alpha$ -methyl acrolein in the presence of various redox systems

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 144, no. 5, 1962, 1091-1093

TEXT:  $\alpha$ -methyl acrolein was polymerized in various redox systems in the presence of a new type of emulsifier, aqueous polyacrolein sulfite. This yields a stable emulsion, and polymerization takes place in the micelles of the emulsifier. Polymerization is carried out in ten times the amount of water with addition of twice the amount of a 2% aqueous emulsifier, all related to the monomer used. The most suitable redox system for this scope is potassium persulfate and silver nitrate which gives high polymer yields of maximum molecular weight. All  $\alpha$ -methyl-acrolein polymers obtained contain 65-70% aldehydic groups, while for polyacrolein prepared in the same redox systems this figure is 20-70%. This is due to the methyl group in the side chain of the  $\alpha$ -methyl acrolein molecule, which prevents the

Card 1/2

Emulsion polymerization of...

3/020/62/144/005/C13/017

B124/B138

cycling of the aldehydic groups, which occurs in the acrolein molecule. The polymers obtained are soluble in pyridine; their intrinsic viscosity in pyridine ranges from 0.19 and 0.43, and molecular weight, determined from the coefficient of progressive diffusion and the intrinsic viscosity, was between 70,000 and 195,000. The white powders obtained could be molded at 200°C and 75 atm to light yellow plates with a softening point between 190 and 215°C. V. Ye. Eskin and S. I. Klenin are thanked for measuring the viscosity, finding the diffusion coefficient, and for calculating the molecular weights of the polymers obtained. There are 2 tables. TITLE: Polymerization of some derivatives of p-vinylbenzoic acid

SOURCE: Karbotsevnye vysokomolekulyarnye soyedineniya (Carbon-chain macro-molecular compounds); sbornik statey. Moscow, Izd-vo AN SSSR, 1963, 195-197

TOPIC TAGS: polymerization, vinylbenzoic acid, vinylbenzoate, vinylbenzamide, polymer physical property, polyvinylbenzoate, dilatometry, azodiisobutyronitrile, butyl peroxide, block polymerization

ABSTRACT: Using a dilatometric method, the authors compared the block and liquid-phase polymerization rates of p-vinylbenzoic acid, its methyl and amyl esters, p-vinylbenzamide and its N-methyl, N,N-dimethyl and N-amyl derivatives, using 0.2 mol.% tert.-butyl peroxide or azodiisobutyronitrile as the initiators, respectively, at 120-180°C. Some of the physical properties (thermal stability, solubility, weight loss during heating) of the polymers obtained were also studied. The polymerization rate of the derivatives of p-vinylbenzoic acid decreased in the following order: acid > amides > esters. It was found that the polymerized amides of p-vinylbenzoic acid have a higher softening point and a higher thermal stability than the corresponding polymerized esters. Orig. art. has: 1 figure

**TOPIC TAGS:** lactone, lactone synthesis, propiolactone, lactone polymerization, pentaerythritol

**ABSTRACT:** The authors accomplished the synthesis of the lactone from pentaerythritol which was successively converted to pentaerythritol trichlorohydrin by the action of chlorothionyl, and then to trichloropivalic acid by the action of nitric acid. Pyrolysis of lead trichloropivalate yields the lactone directly:

Card 1/3

APPROVED FOR RELEASE: 08/23/2000

CIA-RDP86-00513R000825410012-8

ACCESSION NR: AT4034008

In the procedure, 190 g of pentaerythritol trichlorohydrin were treated with an excess of concentrated nitric acid for 30 hrs until the complete removal of nitrogen oxides. The mixture was then cooled down to room temperature and the crystals of trichloropivalic acid were washed with ice water, dried and recrystallized from n-hexane. The acid melted at 109-110 C, and the yield was 60-65% of the theoretical. C-, H- and Cl-analyses and M-determination agreed with the theoretical values. The acid was dissolved in ethyl alcohol and reacted with an equimolar amount of lead acetate. The precipitate of lead trichloropivalate was dried in a vacuum over  $P_2O_5$ . The melting point was 180 C, the yield - 65-70% and the analysis and molecular weight were in agreement with the theoretical. The pyrolysis of the lead salt was carried out on an oil bath at 150-160 C and  $10^{-3}$ - $10^{-4}$  mm vacuum in a specially devised flask preventing the over-heating of the product. Special care was taken to keep the salt absolutely dry. The lactone obtained melted at 35 C, had a yield of 65-78%, a mol. weight of 168.11, and the C-, H-, and Cl-content was in agreement with the theoretical. The thermal polymerization of the lactone was also investigated between 40 and 120 C and the destruction at 300 C. The latter showed that the lactone was stable at up to 250 C. Orig. art. has: 5 figures.

TITLE: Copolymerization of organometallic monomers with styrene

SOURCE: Vy'sokomolekulyarnye soyedineniya, v. 6, no. 10, 1964, 1781-1784

TOPIC TAGS: tin, lead, styrene, p-vinyl phenyl-triphenyltin, p-vinyl phenyl-tricyclohexyltin, p-vinyl biphenyl-triphenyltin, p-vinyl phenyltriphenyl-lead, diazobisobutyronitrile, toluene, copolymerization, organometalloid polymer, styrene copolymer

ABSTRACT: The copolymerization of styrene with tin- and lead containing monomers such as p-vinyl phenyl-triphenyltin (m. p. 109-110°C), p-vinyl-phenyl-tricyclohexyltin (m. p. 104-105°C), p-vinylbiphenyl-triphenyltin (m. p. 142-143°C) and p-vinyl phenyl-triphenyllead (m. p. 105-107°C) was investigated, using diazobisobutyronitrile (0.1% by weight) as the initiator. The copolymerization temperature was 60°C and the degree of polymerization was kept below 25%. The constants of copolymerization  $r_1$  and  $r_2$  were determined and the relative reactivity of the monomers with respect to the styrene radical were calculated. The

Card 1/3

L 10758-65

ACCESSION NR. AP4047203

constants of copolymerization show that all organotin monomers have a higher activity than styrene, and that these monomers combine more readily with their "own" radical than with the foreign radical ( $r_1 > r_2$ ).  $\mu$ -Vinyl phenyl-triphenyllead is less active than  $\mu$ -vinyl phenyl-triphenyltin with respect to the styrene radical. The highest reactivity is shown by  $\mu$ -vinyl phenyl-triphenyltin ( $1/r_2 = 1.41$ )  $>$   $\mu$ -vinyl biphenyl-triphenyltin  $>$   $\mu$ -vinyl phenyl-tricyclohexyltin. Tabulated data show that an increase in the number of substituents and a decrease in the degree of conjugation of the double bonds decreases the activity of the monomer. The substitution of the tin atom by lead leads to a considerable decrease in monomer activity. Thus, the activity of  $\mu$ -vinylphenyl-triphenyllead is close to that of styrene. The correlation between the composition of the copolymer and the time of polymerization shows that tin-containing monomers are more active with respect to styrene because the tin content in the copolymers is larger than the tin content in the initial mixture and the tin content decreases with increasing polymerization time. The constancy of the composition of copolymers of  $\mu$ -vinyl phenyl-triphenyltin and styrene after a 17-hour polymerization is probably due to the intensive formation of cross-linkage resulting from the rupture of hydrocarbon radicals. This is shown by the formation of an insoluble polymer. The increase in viscosity of the copolymers with increasing time of polymerization is

Card 2/3

L-10758-55

ACCESSION NR: AP4047203

associated with increased branching of the polymer chains, leading finally to crosslinkage.

SOURCE: Plasticheskiye massy\*, no. 11, 1964, 1-9

TOPIC TAGS: polymer

ABSTRACT: New polymer syntheses are reviewed, with special emphasis on materials having high thermal stability and high heat resistance. Among Soviet-developed syntheses, the following preparations are mentioned: polymers from acetone; co-polymers of formaldehyde and glycolaldehyde, styrene, methyl methacrylate or phosgene; chlorinated aldehydes; polyesters from dialdehydes (e.g., terephthalaldehyde); polymers from  $\alpha$ -methylacrolein; bis(chloromethyl)arenes; p-diisopropylbenzene; polyacrylonitrile by pyrolysis; and polypyrazoles. Orig. art. has 49 formulas.

TITLE: The synthesis of unsaturated tin organic compounds

SOURCE: Zhurnal obshchey khimii, v. 34, no. 6, 1964, 1757-1758

TOPIC TAGS: synthesis, copolymer, polymerization, organic solvent, tin organic monomer, stanniferous monomer, vinyl compound, metal organic compound

ABSTRACT: The authors investigated a method for developing a synthesis for the polymerization of unsaturated metal organic compounds by first obtaining: n-vinylbiphenyltriphenyltin (I), and n-vinylphenyltricyclohexyltin (II). Tin organic monomers (I and II), colorless crystals, are quite soluble in organic solvents; they polymerize, easily, in bulk as well as in solution and product copolymers with other vinyl compounds. The processes of synthesis are described for both I and II. The authors express gratitude to J. M. Kiselov for his valuable advice and assistance.

This research, part of a study of the synthesis of heat-resistant polymers containing stiff heterocyclic rings in the backbone, was done to study the effect of backbone structure on the thermal stability of such polymers. Polymer II is the first polymer containing B-O-B units ever prepared. The polymers are infusible dark-brown powders soluble in sulfuric acid. Both polymers have low molecular weight, and both, especially II, are stable in air at 300--400°C. Polymer II hydrolyzes in moist air. Orig. art. has: 2 formulas, 1 table, and 1 figure.

TITLE: Reaction of poly-p-vinylbenzoyl chloride with alcohols and amines

SOURCE: Khimicheskiye svoystva i modifikatsiya polimerov (Chemical properties and the modification of polymers); abornik statyj. Moscow, Izd-vo Nauka, 1964, 257-269

TOPIC TAGS: vinylbenzoyl acid, polyvinylbenzoyl chloride, polyacetyl chloride, esterification, amidation, polymer thermoability

ABSTRACT: Under reflux in tetrahydrofuran solution, poly-p-vinylbenzoyl chloride, prepared by polymerizing the monomer at 100°C with 0.2 mol. % azodisobutyronitrile, gave polymeric methyl p-vinylbenzoate with dry methanol, and poly-N-n-amyl-p-vinylbenzamide with n-amylamine. The thermal stability of the polyamide was improved by partial deamination. Yields from 1 g poly-p-vinylbenzoyl chloride and 5 ml amylamine or 10 ml methanol were 0.7 g of the benzamide or 0.8 g of the methyl ester, respectively. Triethylamine was added in both reactions to neutralize liberated HCl. Poly-N-n-amyl-p-vinylbenzamide was also prepared by a second route by polymerizing the monomer at 90°C with azodisobutyronitrile in dimethylformamide solution, yielding after approximately 10% deamination by 2 hrs. of heating at 230-300°C in argon under 3-10 mm Hg pressure.

TITLE. Copolymerization of alpha, beta, beta-halo substituted paradivinylbenzenes with styrene

SOURCE. AN SSSR. Doklady\*, v. 158, no. 5, 1964, 1120-1122

TOPIC TAGS. halosubstituted paradivinylbenzene, copolymerization, styrene, paradivinylbenzene copolymer, reaction kinetics, radical mechanism, copolymerization, kinetics

ABSTRACT. The copolymerizability of styrene and  $\alpha, \beta, \beta$ -halosubstituted p-di-vinylbenzenes, containing two vinyl groups of different activity, was studied. Neither p-vinyl- $\alpha, \beta$ -difluoro- $\beta$ -chlorostyrene (I), p-isopropenyl- $\alpha, \beta$ -difluoro- $\beta$ -chlorostyrene (II), p-bis( $\alpha, \beta$ -difluoro- $\beta$ -chlorostyrene) (IV) would form polymers by radical polymerization, although I and II did form dimers. However I, II, and III copolymerized with styrene under emulsion, solution or bulk radical

TITLE: Polymerization of o-hydroxyphenyl vinyl ketone

SOURCE: AN SSSR, Doklady, v. 159, no. 3, 1964, 602-604

TOPIC TAGS: chelate polymer, o-hydroxyphenyl vinyl ketone, polymer, metal chelate copolymer, methyl methacrylate, divinylbenzene

ABSTRACT: The conditions of the radical polymerization of o-hydroxyphenyl vinyl ketone were studied in an effort to obtain polymers containing chelate groups by direct polymerization or copolymerization. The o-hydroxyphenyl vinyl ketone, synthesized specially for the study, was polymerized in a nitrogen atmosphere by several methods: in solution, in bulk, and in suspension. Either benzoyl peroxide or azobisisobutyronitrile were used as initiators. The polymerization temperature was 75-80°C. The colorless (after reprecipitation) powder-like polymer is soluble in some organic solvents, such as benzene.

Card 1/3

L 16088-65

ACCESSION NR: AP4049923

acetone, pyridine, or dimethylformamide, and in dilute alkalis; it is insoluble in methanol, carbon tetrachloride, or ethyl ether. The molecular weight of 125,000 was determined by the light-dispersion method. The intrinsic viscosity of polymers depends on the method of obtaining them. The lowest values were obtained for the product polymerized in solution, the highest, in suspension. The kinetics of the polymerization were studied, and the curves and the constants were obtained. The IR spectra confirm that polymerization takes place only along the double bonds. The oxime derivatives confirm the presence of the theoretical number of carbonyl groups in the polymers obtained. Products of copolymerization of  $\alpha$ -hydroxyphenyl vinyl ketone with methyl methacrylate or divinylbenzene were also obtained; the latter product has ion-exchange properties. The presence of chelate groups in the polymers studied makes it possible to use these polymers or copolymers for obtaining polymeric complexes with metals. Orig. art. has: 1 formula, 2 tables, and 2 figures.

SOURCE: AN SSSR. Doklady ..., 1965, no. 1, 617-619

TOPIC TAGS: polyimide, polymer, cross linking, thermal treatment

ABSTRACT: Pyromellitic dianhydride, biphenyltetracarboxylic dianhydride, and the dianhydride of an aliphatic tetracarboxylic acid [sic] were condensed with diamino-diphenyl ether and benzidine in dimethylformamide at 150°C. The resulting collections of a series of representative polyimides were used to form polyimide films which were then subjected to thermal treatment. Infrared, gravimetric, and dielectric measurement data indicated that dehydrocyclization (imidization) is essentially complete at 200°C. However, additional thermal treatment at 300—400°C results in a somewhat unexpected considerable increase in elasticity. Since any destructive thermal effects would decrease

Card 1/2

U 38505-65

ACCESSION NR. AP101043

elasticity, and since crystallization is disproved by x-ray data, it was concluded that at higher temperatures cross-linking occurs probably by opening of individual imide rings incorporated in the macromolecules and subsequent formation of imide cross-links between separate macromolecules. This is supported by observation of the 1780 cm<sup>-1</sup> band associated with carbonyl groups in five-membered rings. Further support for cross-linking is provided by thermomechanical tests on the above film. Intermolecular polymerization of this type may be utilized to control the properties of other thermosetting resins. Orig. acc. Inst. of Polymer Chemistry, and 1 formula.

gation, and modulus of elasticity at various temperatures. The data are given in graphic form. On the basis of the data, optimum conditions for film drying and orientation stretching were selected. The results showed that the polymer is suitable for producing high-grade polymer films. In addition to good strength, elasticity, and thermal stability, the films also showed good dielectric properties. Film mechanical strength could be considerably increased by orientation stretching in the softened state: tensile strength attained 5000 kg/cm<sup>2</sup> while film elasticity and flexibility met the most stringent specifications [Sic]. The polymer was considered to be of considerable interest as a material for films suitable for construction, electrical and thermal insulation purposes and for fibers suitable for long-time service at temperatures up to 200C. TOPIC TAGS: polymer, polybenzimidazole, polymer synthesis, polymer property, polycondensation

ABSTRACT: A number of polyalkylene dibenzimidazoles were synthesized by polycondensation of 3,3-diaminobenzidine with the phenyl esters of a number of aliphatic dicarboxylic acids. Equimolar mixtures of the reactants were heated in an argon flow for 2-3 hours at 250-270°C and in a vacuum for an additional 0.5-1 hours (0.03 mm at 270°C). The characteristic viscosity of the products was determined in 0.1-0.2% N solutions of formic acid, and the heat stability was determined by heating for one hour each at 300, 400 and 500°C in air. The polycondensation occurs according to the reaction:

ABSTRACT: The synthesis of carbon chain polymers with peptide and carboxyl groups in the side chains is of interest in the study of biologically active compounds. Poly-alpha-alkylglycyldehydroalanines were synthesized by reacting alpha-chloroacetyldehydroalanine with amines which leads to substitution of the halogen by the amine residue and simultaneous polymerization. The polymerization mechanism is to be discussed elsewhere. The following compounds, unknown in the literature, were synthesized and characterized by elemental analysis and IR spectra: poly-alpha-alkylglycyldehydroalanine, where the term

A.ORG: Institute of High-Molecular Polymers AN SSSR (Institut vysokomolekulyarnykh soyedineniy AN SSSR)TITLE: Structure of methacrolein polymers, obtained in the presence of anionic catalysts. 3rd report in the Series Polymerization of Acrolein and Its DerivativesSOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 12, 1965, 2039-2047TOPIC TAGS: polymerization, polymer structure, reaction mechanism, catalyst/ Nippon Bunko infrared spectrophotometer DS 301, GNM 3 nuclear magnetic resonance spectrometerABSTRACT: The structure of polymers obtained from methacrolein and  $\alpha$ -ethylacrolein in the presence of sodium naphthalene and sodium trityl using the method described by M. M. Koton, I. V. Andreyeva, and Yu. P. Getmanchuk (Dokl. AN SSSR, 155, 836, 1964) was investigated. The structure analysis was performed by chemical means: oxime formation, hydrogenation, oxidation with perbenzoic acid, ozonization, as well as by physical means: infrared spectra, using Nippon-Bunko spectrophotometer DS-301, and NMR spectra, using instrument GNM-3. It was established that the rate of conversion of methacrolein and the structure of the obtained polymer are both functions of the polymerization temperature, as illustrated in Fig. 1. Mechanism of the polymerization

TOPIC TAGS: heat resistant plastic, fire resistant material, dielectric material, polyimide, polypyromellitimide/

ABSTRACT: A study has been made of the preparation and physical and mechanical properties of a polyimide, viz., polypyromellitimide. Test results showed that the polymer may find widespread use as a heat resistant and low temperature resistant material, and is of special interest as a high temperature film dielectric. A polypyromellitimide film similar to the U.S. H-film was prepared from pyromellitic anhydride and bis(4-aminophenyl) ether:

Card 1/2

UDC: .541.6

ACC NR: APPROVED FOR RELEASE: 08/23/2000 CIA RDP86-00513R000825410012-8

Polycondensation to the polyamido acid intermediate was carried out at 15°C. Poly-Pyromellitimide films were prepared by drying solutions of the polyamido acid on glass substrates at 20–40°C followed by heat treatment at 80–400°C to produce transparent, gold-brown in color, thermally stable, nonburning at up to 600–700°C, unaffected by organic solvents, highly resistant to  $\gamma$ - and UV radiation, low temperature resistant, nonshrinking, resistant to humidity, and readily metalized. In its mechanical properties at high temperatures, the material surpasses all existing polymers. These properties can be further improved by orientation stretching, after which they approach those of glass-reinforced plastics and metals. Orig. art. has: 5 figures and 3 tables.

TITLE: Emulsion polymerization of methacrolein

SOURCE: Zhurnal prikladnoy khimii, v. 38, no. 12, 1965, 2740-2744

TOPIC TAGS: emulsion polymerization, methacrolein, catalytic polymerization, high polymer, polymer, acrylic plastic

ABSTRACT: Emulsion polymerization of methacrolein was studied in the presence of potassium persulfate and silver nitrate with a solution of polyacrolein bisulfite as a specific emulsifier. The object of the work was to develop a process for making a soluble polymer with high molecular weight containing reactive aldehyde groups. The optimum ratio of the monomer to water is 1:8 and the optimum polymerization temperature is 50° C. In all experiments the emulsifier content was constant (5 wt % based on the monomer). The amount of the initiator varied but the ratio of silver nitrate

Card 1/3

Z UDC: 678.744

L 13082-66

ACC NR: AP6002215

activator to potassium persulfate oxidative agent was 10:1. The oxygen content in the inert gas was  $0.05 \cdot 10^{-2}$  to  $2 \cdot 10^{-2}$  %. The characteristic viscosity of polyacrolein product increased with increasing depth of polymerization. Presence of aldehyde groups in the polymer product permits further processing into new types of plastic sheets or resin fibers. The dependence of polyacrolein characteristic viscosity upon polymerization duration is shown in Fig. 1. The effect of pH upon polymer characteristic viscosity  $\eta$  is shown in Fig. 2. It was found that the lower the oxygen and propionic aldehyde contaminant content, the higher was the polyacrolein molecular weight. Orig. art. has: 3 figures and 2 tables.

ABSTRACT: The effect of temperature on the state of aggregation of polypyromellitimide was investigated by differential thermal analysis and dilatometry. The experimental procedure followed is described by A. V. Sidorovich and Ye. V. Kuvshinskiy (Zav. lab., 25, No. 9, 1124, 1959). The experimental results are presented graphically (see Fig. 1). It is concluded that, after being subjected to a complete annealing cycle, the polypyromellitimide does not change its state

SOURCE: Khimicheskiye volokna, no. 5, 1966, 20-23

TOPIC TAGS: synthetic fiber, polypyromellitimide

ABSTRACT: The possibility of obtaining fibers from polypyromellitimide has been studied. It was found that heat-resistant, high-modulus, nonshrinking fibers could be obtained under laboratory conditions from polypyromellitimide. Their physical and mechanical properties are found to be considerably better than those of mass-produced heat-resistant fibers. Polypyromellitimide fibers apparently can be used to produce high-temperature cord and textiles, and also filler for plastic materials and textolites. Orig. art. has: 3 figures.

SOURCE: Zhurnal obshchey khimii, v. 36, no. 1, 1966, 87-89

TOPIC TAGS: chemical synthesis, titanium compound, silicon compound, polycondensation, pentaerythritol, molecular structure, isomer

ABSTRACT: In the polycondensation of pentaerythritol tetraacetate and pentaerythritol dichlorhydrin with tetra-n-butoxytitanium and tetra-n-butoxysilane, spirocyclic compounds are formed, containing one to four titanium atoms and one to three silicon atoms in the molecule, depending upon the reaction conditions. In the case of normal and isotetra-butoxysilane, the normal isomer was found to be more reactive. In all cases pentaerythritol tetraacetate was more reactive than pentaerythritol dichlorhydrin. Tetrabutoxytitanium was more active in the reaction with pentaerythritol tetraacetate than either isomer of tetrabutoxysilane.

TITLE: An objective method for measuring the stereophonic effect  
PERIODICAL: Przegląd Telekomunikacyjny, no. 1, 1963, 1-3

TEXT: The method developed at the Instytut Podstawowych Problemów Techniki PAN (Institute for Fundamental Technical Problems, PAS) is based on the measurement of four directional components of the sound. The quality of the stereophony is described by the space localization angle  $\theta_s$  and the error of space localization,  $Q$ . These two parameters can be calculated from four known amplitudes of sound waves received by the ear, viz. the wave amplitude received by the left ear from the left loudspeaker, left ear - right speaker, etc. The localization effect depends on the mutual relationship of the above stereophonic sound components. A block diagram is shown of equipment for sending identical signals to the two channels but spaced at some milliseconds so that they can be received separately by two

microphones. The waveforms corresponding to the sound components are displayed on the screen from the symmetry axis of the loudspeakers, the angle  $\theta_s$  and the error  $Q$  differ from zero. Measured errors of the space localization are shown in diagrams for several arrangements of the loudspeakers. The areas in which the error is below 10% substantially agree with the areas of optimal stereophonic reception determined theoretically in a previous publication (Przegląd Telekomunikacyjny, no. 9, 1962, 257-261). There are 8 figures.

correspondingly, has been ascertained as a function of the distance from the phantom surface. Comparison of spectral distribution, as obtained by this method, with the results of investigations using different equipment and high activity sources up to hundreds of Curie is also presented in this paper. Orig. art. has: 10 figures and 10 formulas. [Author's abstract.]

TEXT: The method suggested for suppressing the Compton background in gamma spectrum measurements, uses a scintillation spectrometer with two NaI(Tl) crystals connected in coincidence. The block diagram of the experimental system is given, and results of measurements of the gamma spectra of Co<sup>60</sup>, Cs<sup>137</sup>, and (Co<sup>60</sup>+Cs<sup>137</sup>) sources are reported. The gamma spectrum curve peaks correspond to the maximum energy of recoil electrons. It is reported that the resolution of these lines proved to be by 20% worse than that of the photolines.

TITLE: Oxidative destruction of polyamides I. Investigation of thermal and radiation oxidation of polycaprolactam by IR spectroscopy

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 30, no. 4, 1964, 370-376

TOPIC TAGS: polyamide, oxidative destruction, oxidation, thermal oxidation, radiation oxidation, polycaprolactam, IR spectra, methylene bond rupture, peptide bond rupture, stabilization, cross linkage, carbonyl containing compound formation

ABSTRACT: Polycaprolactam films were subjected to thermal oxidation at 120-200°C in an atmosphere of oxygen, and to radiation oxidation at 30°C; radiation was effected with cobalt-60, 25 roentgens/sec, and maximum exposure of 400 hours. The changes in the IR spectra were examined and interpreted. In both types of oxidation approximately the same decrease occurred in the relative optical density of the bands for the valency vibration C-H of the methylene groups, the amide I and amide II, indicating rupture of the methylene and the peptide groups. Increase, on oxidation, in the optical density of the 1713  $\text{cm}^{-1}$  band of the C=O vibration
